Practical Assignment Report

Prepared by: Miracle Godwin Ogbo

Domain: Godwin.local

Operating System: Windows Server 2022

Virtualization Platform: VMware

Date: August 2026

ACTIVE DIRECTORY ORGANIZATIONAL STRUCTURE AND PASSWORD POLICY CONFIGURATION

INTRODUCTION

This practical exercise focused on configuring and managing an Active Directory environment using Windows Server 2022.

The exercise involved creating Organizational Units (OUs) representing three different sectors: Banking, Healthcare, and Education. Each sector was configured with four departmental security groups, and users were created and assigned to their respective departmental groups.

The second part of the practical involved modifying the domain password policy by disabling the password complexity requirement through the Default Domain Policy.

The practical provided hands-on experience with Active Directory object management, Organizational Units, user accounts, security groups, group membership, and Group Policy configuration.

OBJECTIVES

The objectives of this practical were to:

1. Create three sector-based Organizational Units within the Active Directory domain.
2. Create four departmental security groups for each sector.
3. Create at least two users for each department.
4. Ensure that each user belongs to only one department.
5. Add users to their appropriate departmental security groups.
6. Configure the domain password policy.
7. Disable the password complexity requirement for domain users.
8. Document the configuration process using screenshots.

LAB ENVIRONMENT

The practical was performed using:

Windows Server 2022

The Windows Server virtual machine was configured as the domain controller for the Godwin.local domain.

TASK 1

ACTIVE DIRECTORY ORGANIZATIONAL STRUCTURE

Three sector-based Organizational Units were created under the Godwin.local domain:

- **OMG-Bank**
- **OMG-HealthCare**
- **OMG-University**

These Organizational Units were used to logically organize the users and departmental security groups according to their respective sectors.

Screenshot 1 — Sector Organizational Units

Three sector-based Organizational Units created under the Godwin.local domain.

1. BANKING SECTOR CONFIGURATION

The OMG-Bank Organizational Unit was created to represent the Banking sector.

Four departmental security groups were created:

- Bank-IT
- Bank-Finance
- Bank-Security
- Bank-Marketing

Users were created within the OMG-Bank OU and assigned to their respective departmental security groups.

Screenshot 2 — Bank Users and Groups

User objects and departmental security groups within the OMG-Bank OU.

Users were then added to their respective departmental groups. Each user was assigned to only one department in accordance with the assignment requirement.

Screenshot 3 — Bank Group Membership

Example of users assigned as members of a Bank departmental security group.

2. HEALTHCARE SECTOR CONFIGURATION

The OMG-HealthCare Organizational Unit was created to represent the Healthcare sector.

Four departmental security groups were created:

- Health-IT
- Health-Medical
- Health-Nursing
- Health-Administration

Users were created within the Healthcare OU and assigned to their respective departmental security groups.

Screenshot 4 — Healthcare Users and Groups

Name	Type	Description
Administrati...	Security Group ...	
Israel Dayo	User	
Job Joshua	User	
Medical-Serv...	Security Group ...	
Nursing	Security Group ...	
Ogah Freem...	User	
Olu Ikechuk...	User	
Pharmacy	Security Group ...	
Precious Job	User	
Ruth Odeh	User	
Titi Johnson	User	
Victor James	User	

User objects and departmental security groups within the OMG-HealthCare OU.

An example of departmental group membership is shown below.

Screenshot 5 — Healthcare Group Membership

Example of users assigned to a Healthcare departmental security group.

3. UNIVERSITY SECTOR CONFIGURATION

The OMG-University Organizational Unit was created to represent the Education sector.

Four departmental security groups were created:

- Uni-IT
- Uni-Academics
- Uni-Student-Affairs
- Uni-Finance

Users were created within the University OU and assigned to their respective departmental security groups.

Screenshot 6 — University Users and Groups

User objects and departmental security groups within the OMG-University OU.

Screenshot 7 — University Group Membership

Example of users assigned to a university departmental security group.

TASK 2

PASSWORD COMPLEXITY CONFIGURATION

The second part of the practical involved disabling the password complexity requirement for domain users.

The configuration was performed through the **Default Domain Policy** in Group Policy Management.

The policy was accessed through:

Group Policy Management → Godwin.local → Default Domain Policy → Edit

The following path was used:

Computer Configuration → Policies → Windows Settings → Security Settings → Account Policies → Password Policy

The setting:

Password must meet complexity requirements

was configured as:

Disabled

Screenshot 8 — Default Domain Policy

Default Domain Policy within the Godwin.local domain.

Screenshot 9 — Password Policy Location

Password Policy configuration under Computer Configuration.

Screenshot 10 — Password Complexity Disabled

Password complexity requirement configured as Disabled.

WHAT I LEARNED FROM THE PRACTICAL

Organizational Unit (OU)

An Organizational Unit (OU) is a container in Active Directory that is used to organize objects such as users, computers, and groups.

In this practical, I created three OUs for the different sectors:

- OMG-Bank
- OMG-HealthCare
- OMG-University

I used each OU to keep the users and departmental groups for each sector organized.

User Objects

A user object represents a user account in Active Directory. When a user is created, information such as the username and account details is stored in Active Directory.

For this practical, I created different users under each sector OU and used a naming format that made it easy to identify which sector the user belongs to.

For example:

Bank.Godwin

Health.Comfort

Uni.Miracle

Security Groups

A security group is used to group users together based on their department or the access they may need.

For example, under the Bank OU, I created:

- Bank-IT
- Bank-Finance
- Bank-Security
- Bank-Marketing

I also created similar departmental groups for the Healthcare and University OUs.

Group Membership

After creating the users and security groups, I added the users to their appropriate departmental groups.

For example:

Bank.Godwin

Bank-IT

This means that Bank.Godwin is a member of the Bank-IT security group.

I made sure that each user was assigned to only one department, as required by the practical.

Group Policy

Group Policy is a feature in Windows Server that allows an administrator to manage settings for users and computers from a central location.

In this practical, I used **Group Policy Management** to modify the password policy for the Godwin.local domain.

I accessed the **Default Domain Policy** and navigated to the Password Policy settings.

Password Complexity

Password complexity is a security setting that controls whether users must follow certain requirements when creating their passwords.

For this practical, I was instructed to disable the password complexity requirement.

I changed:

Password must meet complexity requirements

to:

Disabled

This was done through:

Default Domain Policy

Computer Configuration

Policies

Windows Settings

Security Settings

Account Policies

Password Policy

I learned that Group Policy can be used to control security settings for users in a domain from one central location.

CONCLUSION

From this practical, I gained a better understanding of how Active Directory is used to organize and manage users and groups in a Windows domain.

I learned how to create Organizational Units, create user accounts, create security groups, and add users to their appropriate groups.

I also learned how to use Group Policy Management to change a domain password policy.

Before this practical, I understood some of these Active Directory concepts theoretically, but working with the Windows Server environment helped me understand how they are actually configured and managed.

Overall, this practical gave me more hands-on experience with **Active Directory, OUs, user accounts, security groups, group membership, and Group Policy.**
